Bramha Atlas

Which mutation should we investigate next, and why?

Reviewable research, connected to evidence.

OPEN THE PTEN DEMO →

ACTUAL REFERENCE WORKSPACE / PTEN · 1D5R

The next experiment starts with an evidence decision

One researcher.

Competing explanations.

Limited lab capacity.

MEASUREMENTS

What did each assay measure?

STRUCTURE

Can this position be mapped?

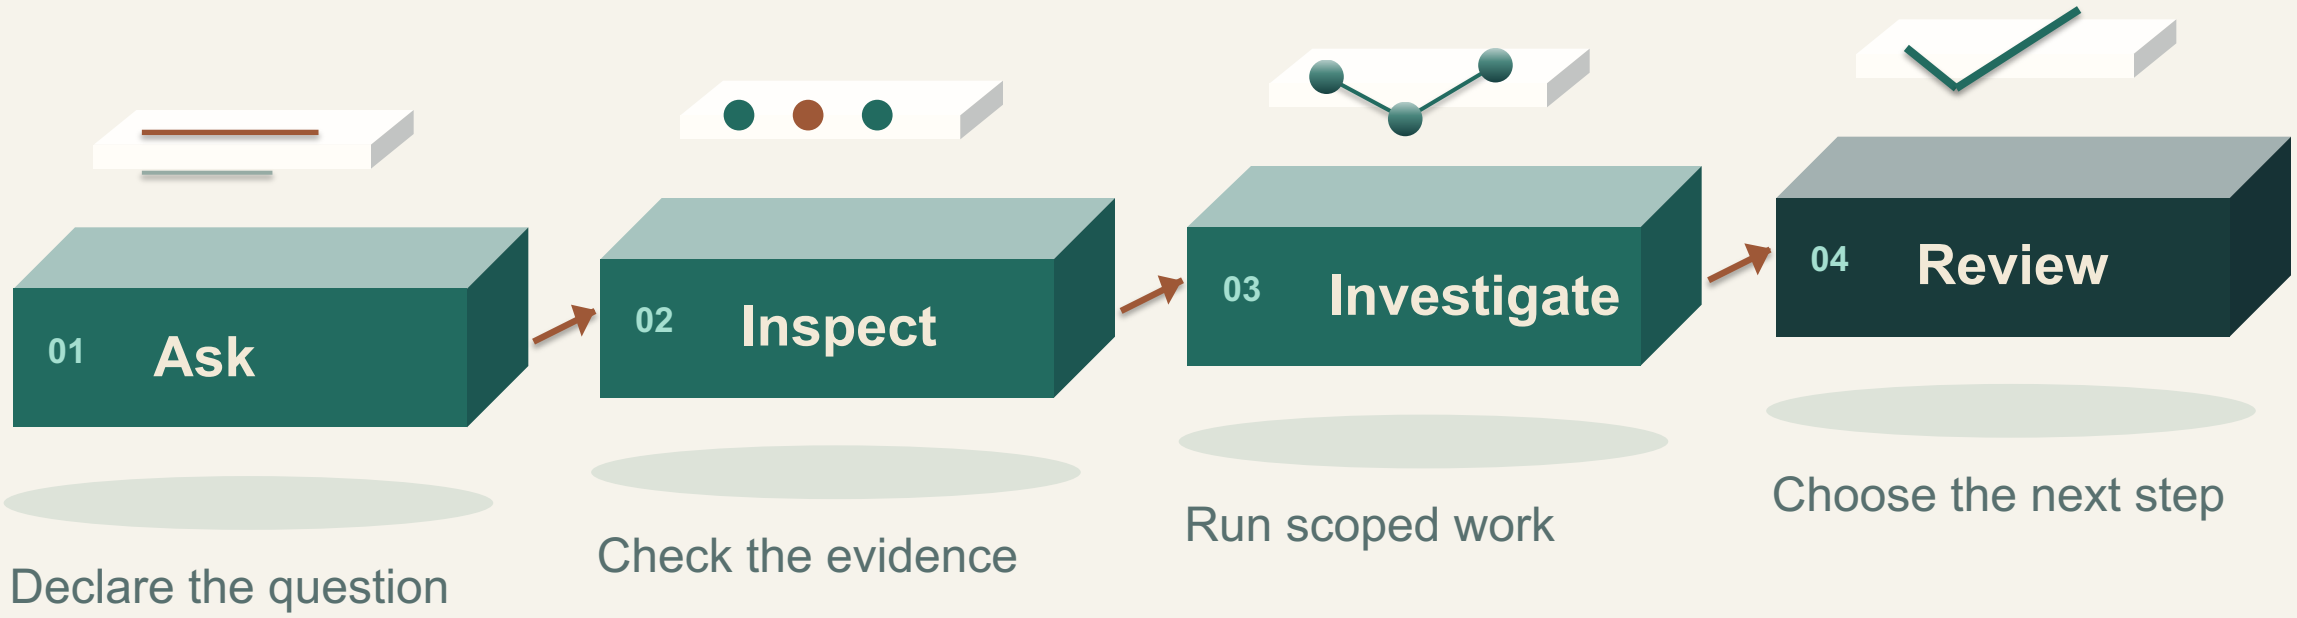

LITERATURE

Does the cited passage apply?

The proposed job: assemble a research decision with evidence and explicit unknowns.

From a question to a brief you can check

3D WORKFLOW SCHEMATIC

A checked research brief, with reproducible artifacts and explicit unknowns.

Three real substitutions. One bounded question.

C124S

Paired measurements

Activity and abundance are both available.

R172H

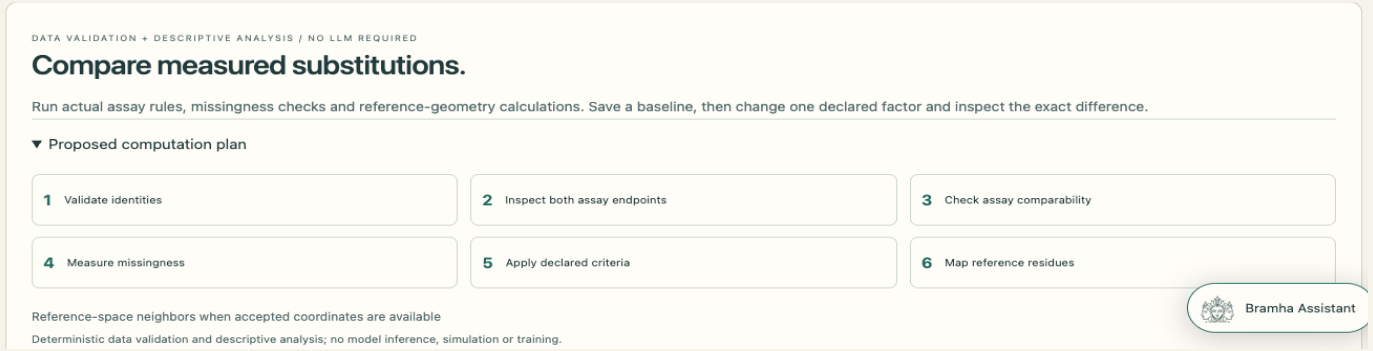

A missing observation

Activity is available; abundance is missing.

Y16T

A different profile

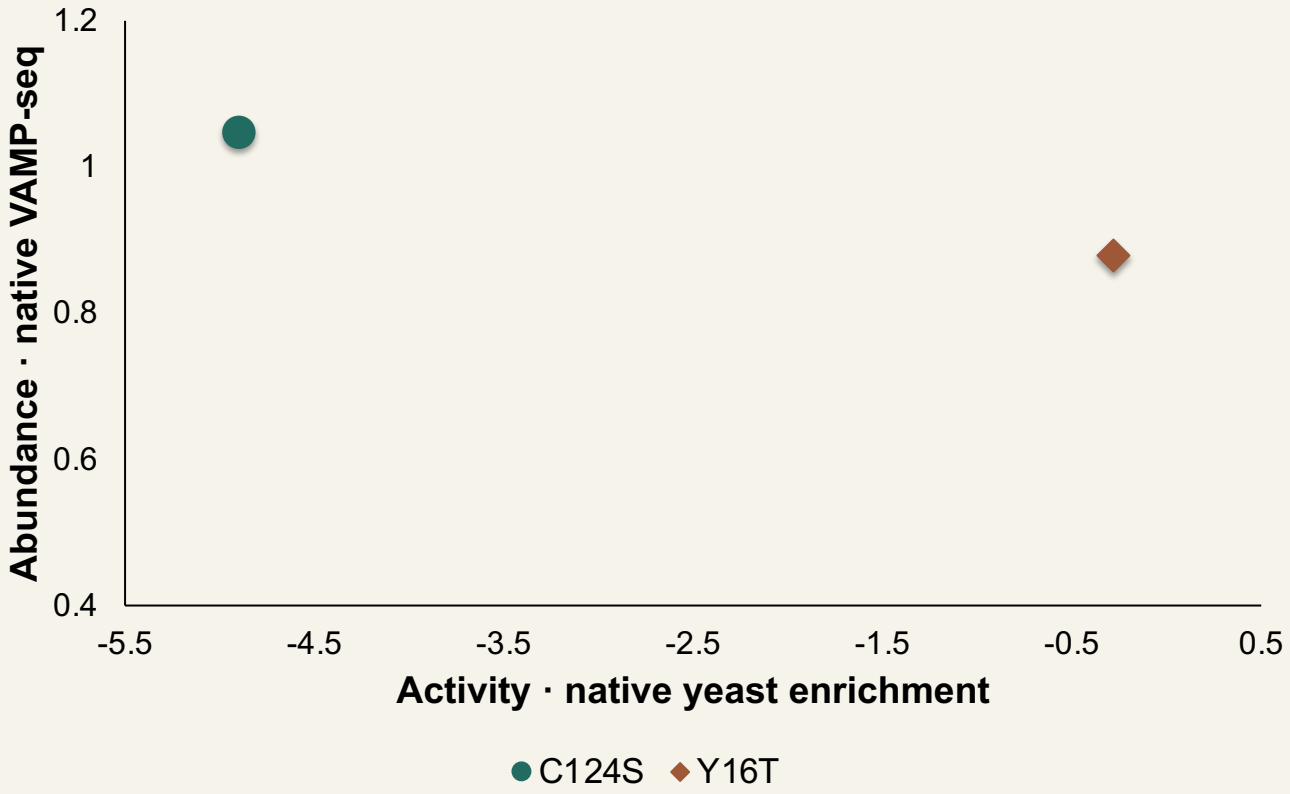

Paired measurements; excluded by baseline rule.

Which profiles meet our rule?

What remains unresolved?

Two assays answer different questions

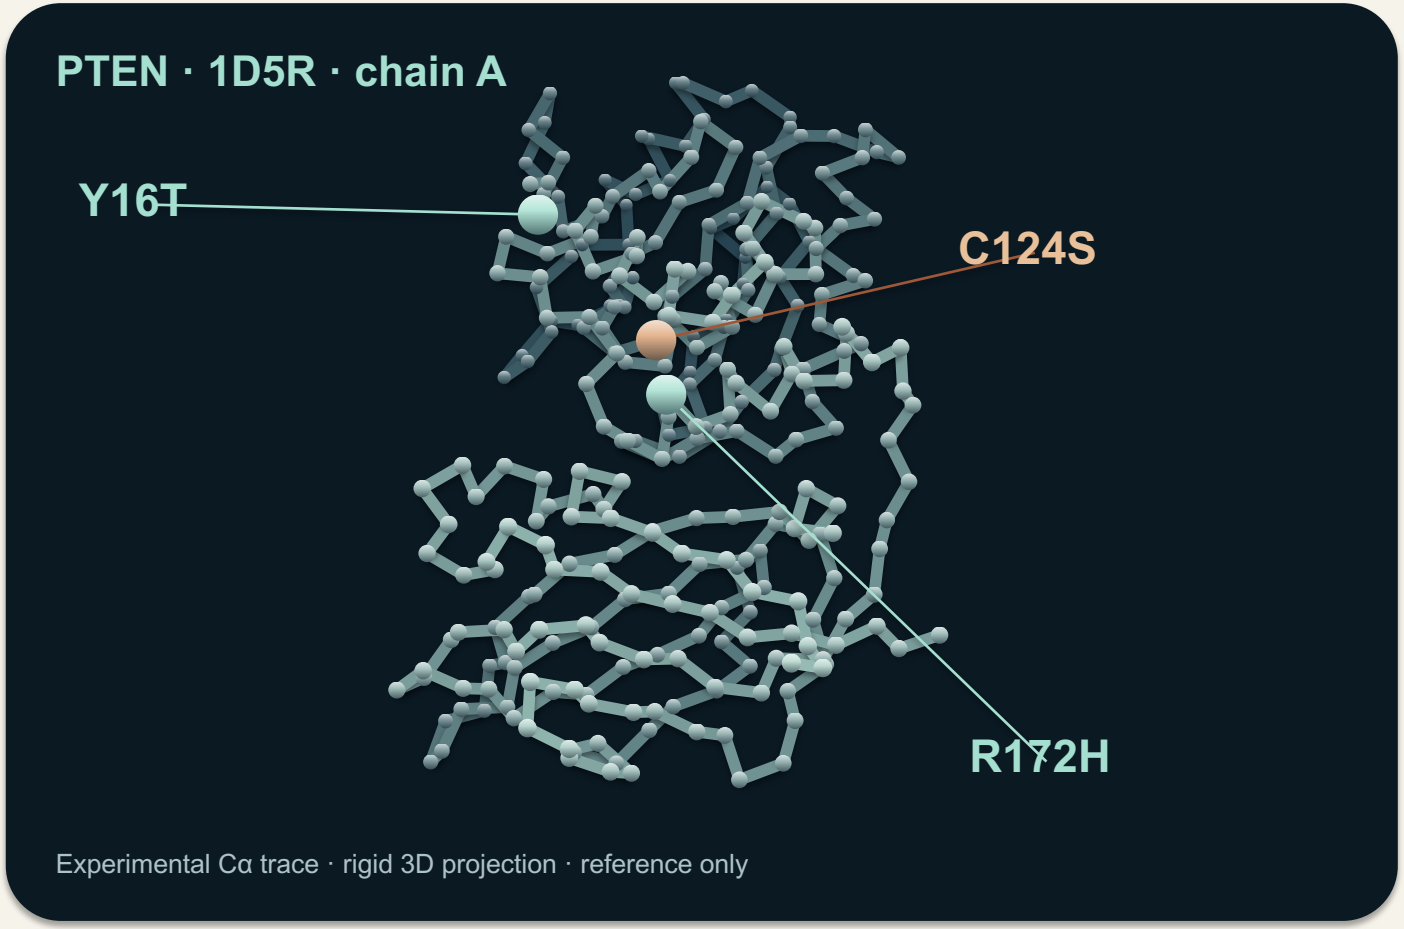

Variant	Activity	Abundance
C124S	-4.896	1.047
R172H	-0.090	Missing
Y16T	-0.282	0.879

2 of 3 have both values.

Missing stays unknown.

Public MaveDB measurements · pinned PTEN snapshot · no cross-assay normalization

A mapped position gives context, not causation

Identity checked

Accepted reference-to-chain mapping.

Context preserved

All three positions are mapped.

The mutant fold was not computed.

Change one rule. See exactly what changes.

UNCHANGED

C124S

EXPLORATORY CRITERION CHANGE · 0 MODEL REQUESTS

Scoped reviews, inspectable handoffs

5

model requests

10

deterministic tool calls

Recorded run

Argon unverified

The useful result includes the unknowns

SUPPORTED BY THE BASELINE

C124S meets the declared paired-measurement rule.

A descriptive shortlist for scientific review.

Still unresolved

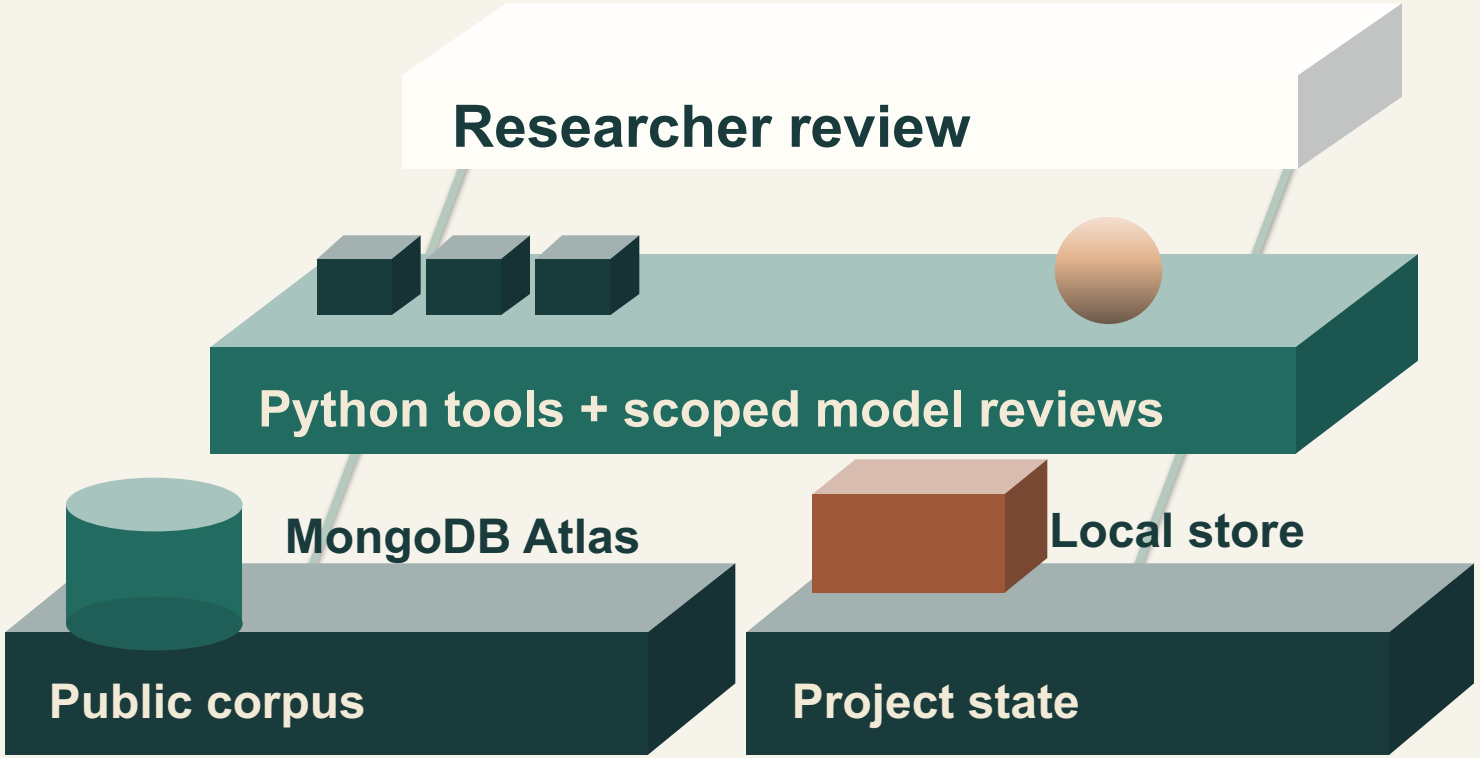

R172H: abundance is missing.

Mechanism and disease relevance
are not established here.

NEXT QUESTION

What additional applicable evidence could distinguish the competing explanations?

Connected evidence, explicit storage boundaries

3D architecture schematic · responsibilities and storage boundaries

REVIEW

Inspect evidence. Decide follow-up.

COMPUTE

Numerical tools + bounded review.

PERSIST

Public corpus / local projects: separate stores.

A prototype with evidence you can inspect

Capability	Evidence in hand	Status
PTEN analysis	Pinned baseline + one-factor follow-up	Demonstrated
Independent reviews	Saved model-backed team run	Recorded; with limits
Public corpus	Atlas connection + stored records	Snapshot verified
Argon scientific run	Connectivity attempt timed out	Unverified
Clinical or causal validity	No qualifying validation in this case	Not established

480 studies / 4,784 passages

Recorded Atlas snapshot · 25 Oct 2026, 05:47 UTC

Start with teams making variant research decisions

01

Academic genomics labs

Review variant evidence before choosing a follow-up experiment.

02

Small biotech teams

Connect measurements, structure and source review in one record.

FIRST PILOT JOB

A reviewed shortlist and a traceable next research question.

A focused workflow in an established ecosystem

Existing tool	Established focus
Benchling	R&D workflows, context and agents
Galaxy	Reproducible computational workflows
MaveDB	Variant-effect datasets and interpretation
Europe PMC	Life-science literature discovery

$3.65B

2024 global drug-discovery informatics estimate

Broad category context
Grand View Research
Not our addressable market

Our proposed focus: one inspectable decision, from declared criteria to unresolved evidence.

The gap is the decision handoff

Why pay when capable free tools exist?

Assay records, structures and relevant passages.

A scientist still needs a defensible next decision.

A checked shortlist, changed inputs and unknowns.

Only if this specific handoff becomes measurably easier and still withstands expert review.

What is closing that gap worth to one lab?

8 cases/month × 2 net hours × $60/hour

= $11,520/year

ILLUSTRATIVE RESEARCH CAPACITY VALUE

5 net hours/month

to cover a $300/month fee
at $60 per researcher hour.

Annual lab fee

$3,600 · proposed

Value after fee

$7,920 · scenario

Low use can fail

2 cases/month: below fee

Assumed net time recovered; capacity value is not measured cash savings.

A testable US entry segment: $0.72–2.16M/year

REFERENCE POOL

2,000

US biotech firms · rounded

ASSUMED FIT

10–30%

200–600 eligible firms

PROPOSED PRICE

$3,600

per account per year

20% fit case: 2,000 × 20% × 1 account × $3,600 = $1.44M/year

Conditional segment value, not forecast revenue. Academic and international expansion excluded.

Charge for a bounded research workspace

Individual researcher

US$30 / month · proposed

Bounded usage; validate with pilots.

Small laboratory

US$300 / month · proposed

Shared review workflow; bounded usage.

20 labs × $300 / month × 12

= $72,000 / year

ILLUSTRATIVE · NOT TRACTION

Pilot the decision, then earn expansion

01 Partner

Recruit 3–5 labs.

Agree on a bounded question.

02 Evaluate

Expert review + task success.

Measure time and errors.

03 Expand

Validate the next gene.

Test repeat use and lab fit.

What earns the next stage?

Traceable results. Useful unknowns.

Researchers who return.

Help shape a research decision worth trusting

Bring one research question.

Seeking pilot labs and scientific advisers.

01

Verify Argon execution

02

Evaluate with researchers

03

Validate gene expansion
